

eHealthbox

CGI

Experience the commitment®

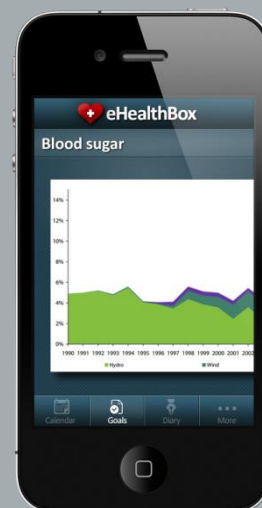

A platform for improving the patient experience; eHealthbox is defining a new engagement between citizens and their healthcare professionals.

eHealthbox is a web based, mobile health platform that makes it possible for the patient, healthcare professionals and other stakeholders to access, monitor and update personal health data.

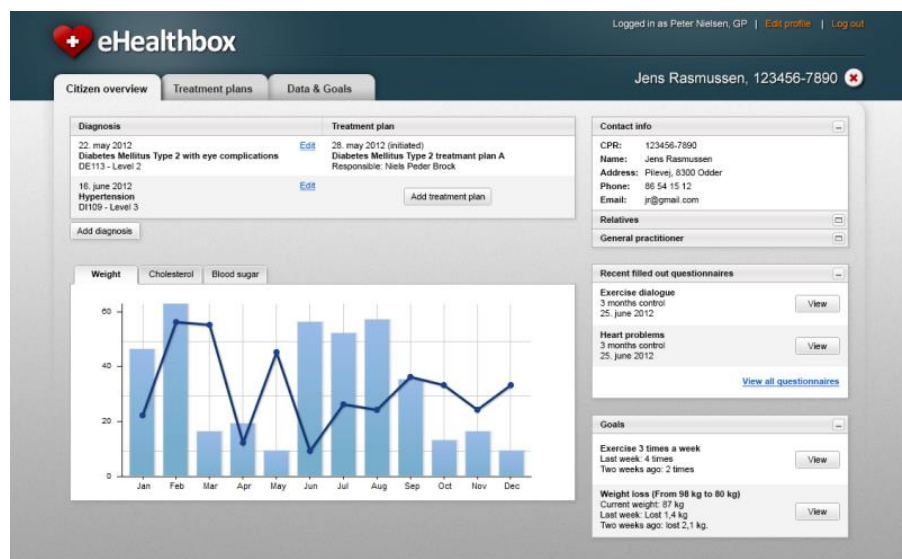

MOBILE UNITS

eHealthbox works on various mobile platforms. The application is adjusted to the different mobile units, so the citizen is presented with data in the most appropriate way.

CLINICAL WEB

The GP, hospital and municipality all have access to the same interface, which displays citizen info and diagnosis, chronic disease plans and all available measurement data.

SUPPORTING CROSS-SECTORAL PATHWAYS

eHealthbox creates an overview for both citizen and clinician, by showing all the individual activities the citizen must attend in order to stay on the chronic disease plan. Activities can be maintained by all sectors – hospital, municipality, GP, external systems, etc.

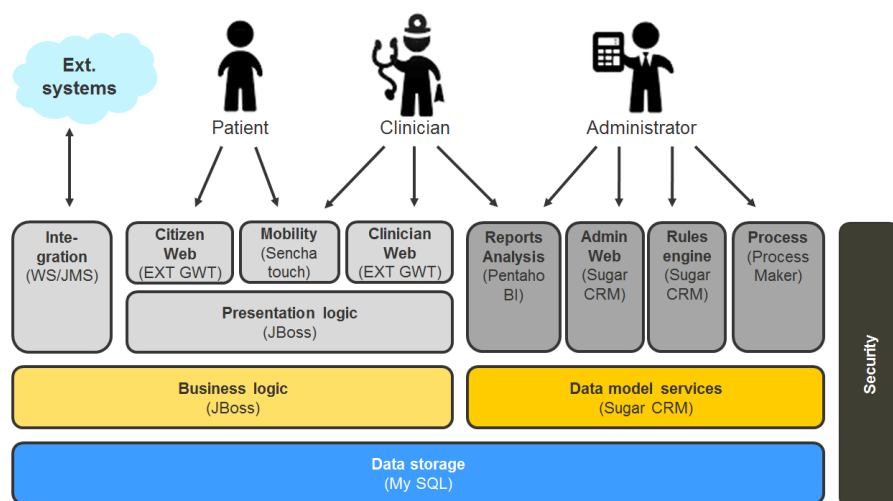

THIS IS MADE POSSIBLE BY:

- Cross-sectoral course planner
- Clarification/notification of whether the plan is kept or not
- Overview of results
- Integration to external systems

ARCHITECTURE

Full featured Shared Care platform – based on open source products

OPEN SOURCE PRODUCTS:

- Data modeling in CRM
- Google Web Toolkit
- HTML5 Framework
- Integration Engine
- Business Intelligence
- Process and Workflow
- Rules Engine
- LAMP stack
