

EndPoint Security

BUSINESS BENEFITS

- Secures network environments
- Protects data and staff
- Complies with regulations
- Guaranteed and measured service availability
- Minimal management
- Shared solutions – fast, effective and replicable, proven by thousands
- Dedicated leading edge solutions with 99.5 % availability
- 24x7 coverage through the MSS SOC

FEATURES

- Centrally managed or unmanaged
- Identifies device coverage
- Prevents unknown, potentially unwanted software from operating
- Eliminates known malicious software
- Manages and controls connection of portable media devices to your organization's PC

CGI's MSS Endpoint Security solutions help you protect your organization's data, both on and off the network. Endpoint Security provides protection against malicious software behavior and enforces usage policies on laptops, workstations, and servers. Endpoint security services provide protection against viruses, Trojan horses, backdoors, potentially unwanted programs, poorly behaving programs and "adware".

Mail servers, workgroup servers and databases can also carry malicious software through your environment without infection or detection. Stop your organization from being identified as a source of infection. CGI MSS can scan data passing through your infrastructure and eliminate outbound threats to your clients, customers and business partners.

Finally, misplaced, lost and stolen laptops, hard drives and the data they contain is a serious concern. At least 50 jurisdictions require the disclosure of data loss, blemishing your reputation. Full disk encryption on the endpoint can protect your data, thus ensuring that losses are limited to the nominal value of the lost or stolen device.
